Group Art Unit.....2167
ExaminerCheryl Renea Lewis
Attorney's Docket No. MS-307431.01
10 Title: Offline Editing of XML Files Using A Solution

INTERVIEW SUMMARY FOR INTERVIEW DATED 10/31/07
REGARDING OFFICE ACTION DATED 7/17/2007

To: Commissioner of Patents and Trademarks
P.O. Box 1450
Alexandria, VA 22313-1450

20 From: Daniel T. McGinnity (Tel: 509-755-7262; Fax: 509-755-7252)
Customer No. 69316

Statement of Substance of Examiner Interview dated 10/31/07

Applicant wishes to sincerely thank Examiner Cheryl Lewis for her time in
25 discussing this application over the phone on 10/31/07 with Applicant's attorney,
Daniel T. McGinnity.

During this interview, the Examiner confirmed the allowed claims 1-25.
Examiner clarified aspects of the outstanding claims objections and §112
rejections and offered helpful input to resolve these issues. The remaining §102
30 rejections of claims 26-30 over Reynar were also discussed. Applicant presented
patentability arguments with respect to claims 26-30. Examiner Lewis suggested
subject matter for amendments that would result in the allowability of claims 26-

30. Thereafter, proposed amendments to adopt the Examiner's suggestions were submitted informally for review by the Examiner. In a follow-up conversation on 11/8/07, agreement was reached as to the allowability of claims 1-30. Examiner Lewis agreed to enter the agreed upon amendments by Examiner's Amendment.

Accordingly, in the interest of expediting allowance of the subject Application and without conceding the propriety of rejections, Applicant approves entry of the Examiner's Amendment. The claims listing beginning on p. 3 of this paper is provided to confirm the Applicant's understanding of the allowable claims 1-30 in marked-up form. If any issues remain that would prevent the allowance of the application, Applicant requests that the Examiner contact the undersigned attorney to resolve the issues.

Respectfully submitted,

Date: 11/14/07

By: /Daniel T. McGinnity, #55444/

Claims Listing

1. (Currently Amended) A method implemented at least in part by a
5 computer comprising:

reading a processing instruction (PI) in an XML data file governed by a
solution to determine the solution's origin, wherein the PI contains an entity
selected from the group consisting of:

a href attribute that points to a URL;

10 a name;

a target that includes a character string that identifies an application
used to create an HTML electronic form associated with the XML data file;
and

a href attribute and at least one of a PI version and a product version;

15 determining security precautions for executing the solution based on the
solution's origin; and

silently installing the solution from a source other than the solution's origin
within a sandbox enforcing the security precautions.

2. (Original) The method of claim 1, wherein the silently installing the solution further comprises an act selected from the group consisting of:

(i) discovering the solution using the URL in the PI;
(ii) examining the name of the PI to assess the likelihood that the PI includes a solution identifier for the solution; and

when the likelihood exceeds a threshold, discovering the solution using the name in the PI;

(iii) examining one of a URL or an URN in the PI to assess the likelihood that the PI includes a solution identifier for the solution; and

when the likelihood exceeds a threshold, discovering the solution using the one of a URL or an URN;

(iv) discovering the solution using a name associated with the href attribute;

(v) discovering the solution using a name in the PI that is associated with the href attribute; and

(vi) a combination of the foregoing.

3. (Original) The method of claim 1, wherein determining security precautions based on the solution's origin includes a high level of security precautions when the solution's origin is a remote server accessed through a global internet.

4. (Original) The method of claim 1, wherein determining security precautions based on the solution's origin includes a low level of security precautions when the solution's origin is a locally-accessible memory source.

5. (Original) The method of claim 1, wherein determining security precautions based on the solution's origin includes a moderate level of security precautions when the solution's origin is a remote server accessed through an intranet.

6. (Original) The method of claim 1, wherein the source other than the solution's origin is a local memory source.

7. (Original) The method of claim 1, further comprising, without user interaction:

opening the XML data file governed by the solution, wherein:

the solution includes an XSLT presentation application and an XML

schema;

the XML data file can be inferred from the XML schema; and

portions of the XML data file are logically coupled with fragments of the XML schema;

executing the XSLT presentation application to transform the coupled portions of the XML data file into the HTML electronic form containing data-entry fields associated with the coupled portions.

8. (Original) The method as defined in Claim 7, wherein one or more of the reading, the determining, and the silently installing are performed by the execution of a document manager application that is different from the application used to create the HTML electronic form associated with the XML data file.

5 **9.** (Original) The method as defined in Claim 7, wherein:
the data-entry fields of the HTML electronic form map to a corresponding
plurality of nodes of the XML document; and
the method further comprises:
receiving, through the data-entry fields, data input by a user for
storage in a corresponding said node in the XML document; and
outputting data in XML for viewing by the user in the HTML
electronic form through the data-entry fields via the mapping of the data-
entry fields from corresponding said nodes of the XML document.

10 **10.** (Original) The method as defined in Claim 1, wherein the character
string includes “mso-InfoPathSolution”.

15 **11.** (Original) A computer-readable medium comprising instruction that,
when executed by a computer, performs the method of Claim 1.

12. (Original) A system comprising:

a display having a screen capable of displaying icons or text representing an XML data file;

a user-input device capable of enabling a user to select the XML data file;

a network interface capable of communicating with a communications network to download an XML data file's solution application;

a computer capable of executing applications and communicating with a local memory source to store the XML data file's solution application; and

a document manager application executable on the computer and configured to:

read a PI in the XML data file from the local memory source without user interaction, wherein the PI contains an entity selected from the group consisting of:

a href attribute that points to a URL;

a name;

a target that includes a character string that identifies an application used to create an HTML electronic form associated with the XML data file; and

a href attribute and at least one of a PI version and a product version;

discover and deploy, without user interaction, the XML data file's solution using the entity.

13. (Original) The system as defined in Claim 12, wherein the character string includes “mso-InfoPathSolution”.

14. (Original) The system of claim 12, wherein the discover and deploy further comprises an act selected from the group consisting of:

(i) discovering the XML data file’s solution using the URL in the PI;
(ii) examining the name of the PI to assess the likelihood that the PI includes a solution identifier for the XML data file’s solution; and

when the likelihood exceeds a threshold, discovering the XML data file’s solution using the name in the PI;

(iii) examining one of a URL or an URN in the PI to assess the likelihood that the PI includes a solution identifier for the XML data file’s solution; and

when the likelihood exceeds a threshold, discovering the XML data file’s solution using the one of a URL or an URN;

(iv) discovering the XML data file’s solution using a name associated with the href attribute;

(v) discovering the XML data file’s solution using a name in the PI that is associated with the href attribute; and

(vi) a combination of the foregoing.

15. (Original) The system of claim 12, wherein the document manager application is further configured to:

open the XML data file governed by the XML data file's solution, wherein:

the XML data file's solution includes an XSLT presentation application and an XML schema;

the XML data file can be inferred from the XML schema; and

portions of the XML data file are logically coupled with fragments of the XML schema;

execute the XSLT presentation application to transform the coupled portions of the XML data file into the HTML electronic form containing data-entry fields associated with the coupled portions.

16. (Original) The system as defined in Claim 15, wherein the document manager application is different from the application used to create the HTML electronic form associated with the XML data file.

17. (Original) The system as defined in Claim 15, wherein:
the data-entry fields of the HTML electronic form map to a corresponding plurality of nodes of the XML document; and
the document manager application is further configured to:
5 receive, through the data-entry fields, data input by a user for storage in a corresponding said node in the XML document; and
output data in XML for viewing by the user in the HTML electronic form through the data-entry fields via the mapping of the data-entry fields from corresponding said nodes of the XML document.

18. (Original) The system of claim 12, wherein the document manager application is further capable of silently deploying the XML data file's solution within a sandbox.

19. (Currently Amended) An apparatus comprising:

means for displaying a representation of an XML data file;

means for selecting the XML data file;

processor means for reading a processor instruction (PI) ~~PI~~ in the XML data

5 file, wherein the PI contains an entity selected from the group consisting of:

a href attribute that points to a URL;

a name;

a target that includes a character string that identifies an application

used to create an HTML electronic form associated with the XML data file;

10 and

a href attribute and at least one of a PI version and a product version;

means, using the entity, for discovering and deploying, without user

interaction, a solution application governing the XML data file from an offline

memory source;

15 means for displaying the HTML electronic form, wherein the HTML

electronic form represents a product of the solution application and the XML data

file;

means for enabling a user to enter information into the HTML electronic

form;

20 means for receiving information entered into the HTML electronic form;

and

means for altering the XML data file to reflect the information received.

20. (Original) The apparatus of claim 19, wherein means for discovering and deploying further comprises means selected from the group consisting of:

(i) means for discovering the solution application using the URL in the PI;
(ii) means for examining the name of the PI to assess the likelihood that the PI includes a solution identifier for the solution application; and

means, when the likelihood exceeds a threshold, for discovering the solution application using the name in the PI;

(iii) means for examining one of a URL or an URN in the PI to assess the likelihood that the PI includes a solution identifier for the solution application; and

means, when the likelihood exceeds a threshold, for discovering the solution application using the one of a URL or an URN;

(iv) means for discovering the solution application using a name associated with the href attribute;

(v) means for discovering the solution application using a name in the PI that is associated with the href attribute; and

(vi) a combination of the foregoing.

21. (Original) The apparatus of claim 19, wherein:
the solution application includes an XSLT presentation application and an XML schema;
the XML data file can be inferred from the XML schema; and
5 portions of the XML data file are logically coupled with fragments of the XML schema;
the XSLT presentation application can be applied to transform the coupled portions of the XML data file into an HTML electronic form containing data-entry fields associated with the coupled portions.

10
22. (Original) The apparatus as defined in Claim 19, further comprising a document manager application that includes the means for displaying, the means for enabling, the means for receiving, and the means for altering, wherein the document manager application is different from the application used to create the
15 HTML electronic form associated with the XML data file.

23. (Original) The apparatus as defined in Claim 19, wherein:
the user enters the information into the HTML electronic form in data-entry fields of the HTML electronic form that map to a corresponding plurality of nodes of the XML document;

5 the means for receiving information entered into the HTML electronic form receives, through the data-entry fields, data input by the user for storage in corresponding said nodes in the XML document; and

the means for altering the XML data file to reflect the information received maps the data-entry fields to corresponding said nodes of the XML document.

10 **24.** (Original) The apparatus of claim 19, the means, using the entity, for discovering and deploying further comprises means for deploying the solution application within a sandbox providing security based on the solution application's origin.

15 **25.** (Original) The apparatus as defined in Claim 19, wherein the character string includes "mso-InfoPathSolution".

26. (Currently Amended) A computer readable medium comprising instruction that, when executed by a computer:

reads a processing instruction (PI) in an XML data file governed by a solution to determine the solution's origin, wherein the PI contains an href attribute that points to a URL;

determines security precautions for executing the solution based on the solution's origin, wherein the security precautions indicate a trust level in the solution; and

silently installs the solution from a source other than the solution's origin within a sandbox enforcing the security precautions to limit operations of the solution according to the trust level.

27. (Currently Amended) A computer readable medium comprising instruction that, when executed by a computer:

reads a processing instruction (PI) in an XML data file governed by a solution to determine the solution's origin, wherein the PI contains a name;

determines security precautions for executing the solution based on the solution's origin, wherein the security precautions indicate a trust level in the solution; and

silently installs the solution from a source other than the solution's origin within a sandbox enforcing the security precautions to limit operations of the solution according to the trust level.

28. (Currently Amended) A computer readable medium comprising instruction that, when executed by a computer:

reads a processing instruction (PI) in an XML data file governed by a solution to determine the solution's origin, wherein the PI contains a target that includes a character string that identifies an application used to create an HTML electronic form associated with the XML data file;

determines security precautions for executing the solution based on the solution's origin, wherein the security precautions indicate a trust level in the solution; and

silently installs the solution from a source other than the solution's origin within a sandbox enforcing the security precautions to limit operations of the solution according to the trust level.

29. The computer readable medium as defined in Claim 19, wherein the character string includes "mso-InfoPathSolution".

30. (Currently Amended) A computer readable medium comprising instruction that, when executed by a computer:

reads a processing instruction (PI) in an XML data file governed by a solution to determine the solution's origin, wherein the PI contains a href attribute and at least one of a PI version and a product version;

determines security precautions for executing the solution based on the solution's origin, wherein the security precautions indicate a trust level in the solution; and

silently installs the solution from a source other than the solution's origin within a sandbox enforcing the security precautions to limit operations of the solution according to the trust level.
